ONE OF THE WORLD'S LARGEST BATTERY MANUFACTURERS

The Panasonic Energy Co., Ltd. is globally active in our consumer battery business that supports everyday convenience and comfort, as well as our B2B business such as industrial batteries and automotive batteries that support social infrastructure across a broad area.

17 CO₂-FREE FACTORIES^{*1}

Our goal is to produce our products with zero emissions by 2050. Already today, our batteries are manufactured emission-free in 17 factories. Find out more on page 6.

For nearly 100 years, Panasonic has contributed to enriching people's lifestyles and making society more convenient through the introduction of various industry-first technologies as a leading battery manufacturer. Our strengths are our technological capabilities in materials development, manufacturing, and intellectual property. These key strengths serve as an "Enabler" for our customers in market creation and solutions providing combined with our highly reliable brand record that we have cultivated over many years.

Going forward, we will focus on the 'automotive' and 'industrial and consumer' businesses, namely the 'green' and 'digital' fields, where we can make a significant contribution to solving environmental issues and leverage our strengths. In the automotive business, electric vehicles (EVs) are entering a period of fully-fledged dissemination on a global scale aiming to reduce environmental impact, as the global battery market is increasing significantly. In the industrial and consumer business, new demands are being generated due to the accelerating electrification of social infrastructure, such as increased data volume due to the expansion of the digital society and the effective use of renewable energy.

In these focused fields, we will maximize our contribution to society by reducing CO₂ emissions, establishing a safe and secure social infrastructure, and providing convenient and comfortable lifestyles through our cutting-edge technologies and diverse product lineup.

PANASONIC GREEN IMPACT: BUILDING A NET-ZERO FUTURE TOGETHER.

At Panasonic Holding, we commit to significantly reducing our CO₂ emissions, striving to achieve net-zero emissions by 2050. This forms the foundational pillar of the Panasonic GREEN IMPACT initiative. The second pillar revolves around empowering society to avoid emissions through the widespread deployment of our existing and upcoming technologies to customers globally. Together, we forge a path toward a sustainable future.

With 31 net-zero CO₂ factories already now and all of the approximately 250 Panasonic factories globally converted into net-zero factories by 2030, we take on the challenge of achieving net-zero CO₂ emissions across our entire value chain by 2050. But sustainability is not only the center of attention in our production:

Panasonic Holding provides products that are essential building blocks in the joint effort to respond to the needs of today's world. Join us in our obligation to maintain and nurture the ecology of this planet.

EMPOWERING ENERGY SOLUTIONS WITH SECONDARY BATTERIES

Harness the power of innovation with our reliable Nickel-Metal-Hydride secondary batteries. Designed to store energy efficiently and sustainably, they play a pivotal role in powering our rapidly evolving world. From renewable energy storage like solar systems and wind turbines, our secondary batteries are the go-to choice for reliability and long-lasting performance of up to 10 years. Produced without Lead or Cadmium and in a net-zero factory in Wuxi (China), our Nickel-Metal-Hydride batteries can be your sustainable energy storage solution.

If your application needs a high energy density battery, we are ready to guide you through our comprehensive lineup of Lithium-ion cells. Here, we work on three areas: strengthening our competitiveness, enhancing our supply chain, and expanding our production capacity.

OUR MISSION

Achieving a society in which the pursuit of happiness and a sustainable environment are harmonized free of conflict.

OUR WILL

Doing what humankind requires.

OUR VISION

Energy that changes the future.

Environmental management

Zero CO₂ factories

Global warming prevention

Ressource recycling

Environmental communication

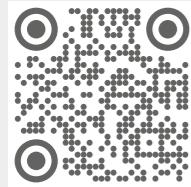

INFORMATION CHANNELS: MEDIAPOL AND YOUTUBE

MEDIAPOL

A MEDIA LIBRARY, JUST AS USERS EXPECT IT.

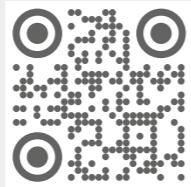

Our online library offers a wide range of images, videos, datasheets, manuals, and catalogs, as well as whitepapers. All content is categorized, but can also be found through the search function. Each relevant search result in the preview can be downloaded through the shopping cart. Additionally, the URL of a media asset can be easily copied and shared.

Get a first idea of how to use the Mediapol, or simply download any file you need. Our Mediapol is accessible for free and without registration.

ABOUT OUR LITHIUM PRODUCTS

Ever since Panasonic became the first company in the world to develop and commence the mass production of Lithium batteries for consumer products in 1971, Panasonic has launched a series of lithium batteries in many shapes and sizes including cylindrical types, coin types and pin types. Panasonic has also successfully introduced coin type rechargeable Lithium batteries to the market for applications such as memory back-up or watches.

Today, Lithium batteries have a proven track record of opening up a host of new fields where conventional batteries cannot be used. Applications range from high-current discharge applications typified by 35 mm cameras to ultra-low current discharge applications in

such products as electronic watches or applications as power supplies for IC memory back-up which require long-term reliability.

Panasonic has conducted repeated tests on the various safety and performance characteristics, plus the effects of environmental factors such as temperature. We have accumulated a wealth of corroborative data on the performance of our batteries which cannot be pinpointed by short-term accelerated tests. As a result, Panasonic batteries have won approval under the UL safety standards in the United States and wide recognition throughout the world for their high reliability and safety.

SAFETY WARNINGS AND PRECAUTIONS

Please be sure to observe the following warnings. As batteries contains flammable substances such as lithium or other organic solvents, they may cause heating, rupture or ignition.

CYLINDRICAL TYPE LITHIUM BATTERIES

WARNING

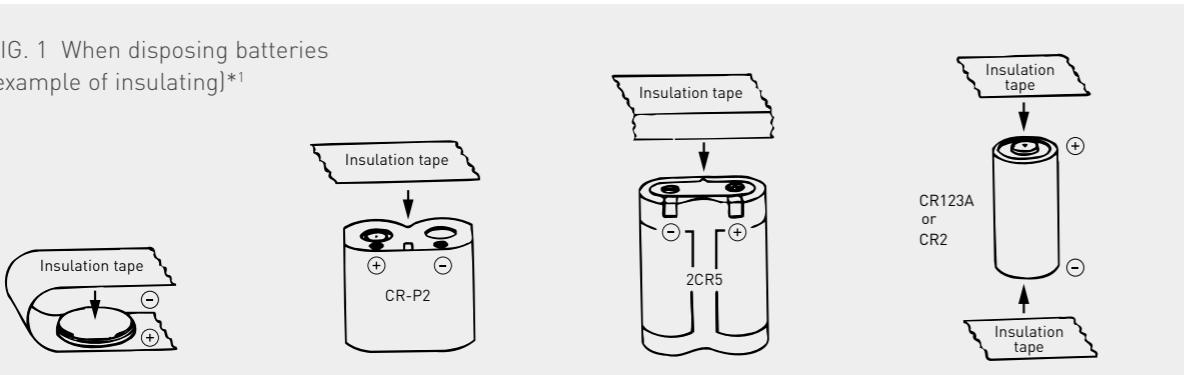

1. It may cause rupture or ignite.
 - | Do not charge, short (an exception is to pass batteries through dipping solder) disassemble, deform or heat batteries. Do not throw batteries into fire.
 - | Do not connect the \oplus and \ominus electrodes to each other with metal or wire. Do not carry or store batteries together with a metallic necklace, etc
 - | Avoid inverted connection of \oplus and \ominus terminals to devices
 - | Avoid mixed use of new and old batteries or batteries of other series.
 - | Avoid direct soldering to batteries.

2. When discarding batteries, insulate the \oplus and \ominus terminals of batteries with insulating tape, etc. (see fig. 1). When disposed of improperly, lithium batteries may short, causing them to become hot, burst or ignite.
3. Keep batteries out of reach of small children. Should a child swallow a battery, consult a physician immediately.

CAUTION

Keep batteries away from direct sunlight, high temperature, and high humidity.

FIG. 1 When disposing batteries (example of insulating)*1

COIN TYPE LITHIUM BATTERIES

WARNING

1. Do not charge, short (an exception is to pass batteries through dipping solder) disassemble, deform or heat batteries. Do not throw batteries into fire.
2. Keep batteries out of reach of small children. Should a child swallow a battery, consult a physician immediately.
3. When discarding batteries, insulate the \oplus and \ominus terminals of batteries with insulating tape, etc. (see fig. 1). When disposed of improperly, lithium batteries may short, causing them to become hot, burst or ignite.

CAUTION

1. Be sure to connect the \oplus and \ominus electrodes correctly.
2. Avoid mixed use of batteries, i.e. new, used or different types.
3. Avoid direct soldering to batteries.
4. Keep batteries away from direct sunlight, high temperature, and high humidity.

COIN TYPE RECHARGEABLE LITHIUM BATTERIES

WARNING

1. Do not short-circuit (an exception is to pass batteries through dipping solder), disassemble, deform or heat batteries. Do not throw batteries into fire.
2. Do not charge rechargeable batteries with a higher voltage than specified.
3. Keep batteries out of reach of small children. Should a child swallow a battery, consult a physician immediately.
4. When discarding batteries, insulate the \oplus and \ominus terminals of batteries with insulating tape, etc. (see fig. 1). When disposed of improperly, lithium batteries may short, causing them to become hot, burst or ignite.

CAUTION

1. Be sure to connect the \oplus and \ominus electrodes correctly.
2. Avoid mixed use of batteries, i.e. new, used or different types.
3. Avoid direct soldering to batteries.
4. Keep batteries away from direct sunlight, high temperature, and high humidity.

INTRODUCTION

These days Lithium battery technologies are getting more and more important. Due to their high voltage, low self-discharge and proven reliability a broad range of applications can be powered. In particular the BR, CR and ER battery technologies are leading the industries. Please study the comparison overview below and find out why Panasonic is especially emphasizing on its famous BR and CR technology which is a proof for outstanding quality for years in the market.

PRIMARY VS. RECHARGEABLE LITHIUM BATTERIE CHEMISTRIES*1

GENERAL FEATURES

HIGH VOLTAGE

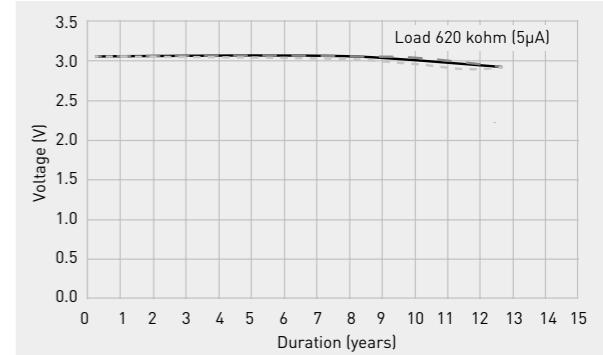

The high energy density of lithium batteries and their high voltage of 3V (there are 1.5V and 3.8V lineups also) make them ideally suited for use in all kinds of products where the trend is to achieve increasing miniaturization. A single lithium battery can replace two, three or more conventional batteries.

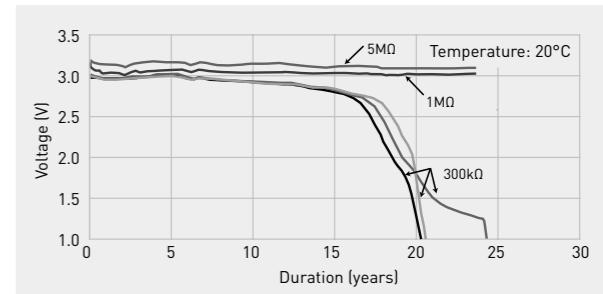

LONG-TERM DISCHARGE

Long-term discharge has been verified at all operating temperatures under low-load discharge conditions.

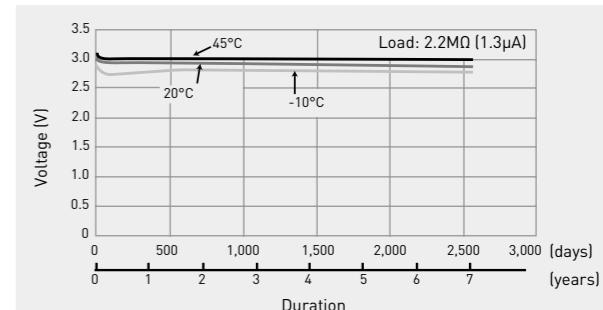

CR-2/3AZ

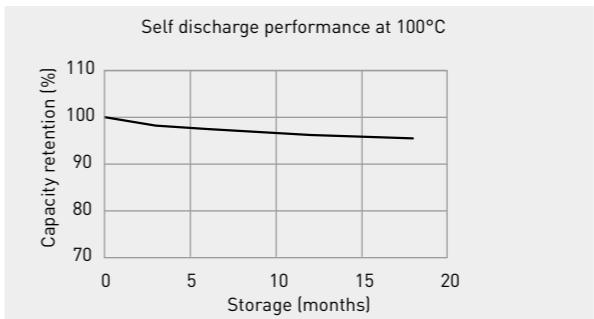

BR-2/3A

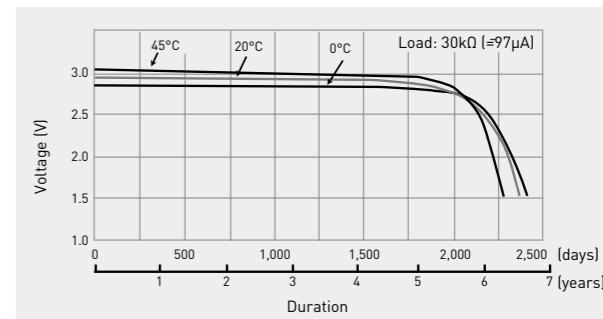

BR-2325

BR-2330A

BR-C

GENERAL FEATURES

OUTSTANDING ELECTROLYTE LEAKAGE RESISTANCE

Lithium batteries employ organic electrolytes with minimum creeping so they are vastly superior in terms of leakage resistance under environmental changes compared to other types of batteries that employ aqueous solution electrolytes. The batteries achieve stable characteristics under high temperature and humidity conditions (45°C/90% RH, 60°C/90% RH), and even under heat shock which constitutes the severest challenge for batteries.

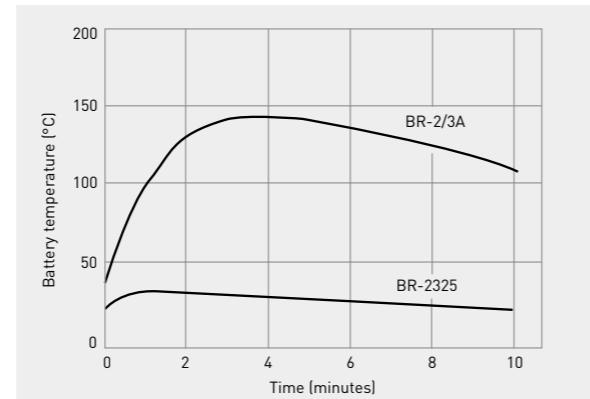

WIDE OPERATING TEMPERATURE RANGE

Due to the use of organic electrolytes with a solidifying point that is much lower than the aqueous solution electrolytes used in other types of batteries, lithium batteries are capable of operation in a wide range of temperatures. Not only do the high operating temperature BR series cells use a special engineering plastic as the material for the gasket and separator instead of the conventional polyolefin resin but its operating temperature range has also been significantly increased by employing an electrolyte with a high boiling point.

SUPERIOR SAFETY

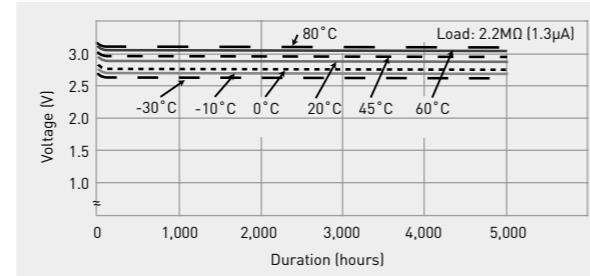

Lithium batteries feature stable substances for the active materials and a structural design that assures safety and, as such, their superior safety has been verified from the results of repeatedly subjecting them to a number of different safety tests. As a result, Panasonic's Lithium batteries have been approved under the safety standard (UL1642) of UL (Underwriters Laboratories Inc.).

PRIMARY VS. SECONDARY LITHIUM BATTERIES

COIN TYPE RECHARGEABLE LITHIUM BATTERIES

Rechargeable lithium batteries come with excellent characteristics and high reliability.

- Long-term reliability
- High capacity
- Low self-discharge rate
- Resistance to continuous discharge
- Resistance to over discharge

COMPARISON TABLE OF LITHIUM BATTERY TYPES

ITEM	TYPE	PRIMARY BATTERY		SECONDARY BATTERY			
		BR	CR	VL	ML	MT	CG
MATERIAL	⊕ electrode	(CF)n	MnO ₂	V ₂ O ₅	LixMnO _y	LixO _y	Co
	⊖ electrode	Li	Li	LiAl	LiAl	LixTiO _y	Li
NOMINAL VOLTAGE [V]		3.0	3.0	3.0	3.0	1.5	3.8
OPERATING TEMPERATURE RANGE [°C]	Cylindrical: -40 to +85 Coin: -30 to +85 High operating temperature coin: -40 to +125 Pin: -30 to +80	Cylindrical: -40 to +70 -85 Coin: -30 to +85 High operating temperature coin: -40 to +105 -125		-20 to +60	-20 to +60	-10 to +60	0 to +60 (charging) -20 to +60 (discharging)
SELF-DISCHARGE [per year] under standard conditions	Cylindrical type Coin type	0.5% 1.0%		2.0% 2.0%	2.0% 2.0%	2.0% 1.0%	1.0%
AVERAGE DISCHARGE VOLTAGE [V]	-	-	2.85	2.5	1.2	3.7	
CHARGE VOLTAGE [V]	-	-	3.25 to 3.55	2.8 to 3.2	1.6 to 2.6	4.3	
CUT OFF VOLTAGE [V]	2.0	2.0	2.5	2.0	1.0	3.0	
CHARGE-DISCHARGE CYCLES	-	-	1,000 charge/discharge partly (charge/discharge for 10% of discharge depth)	1,000 charge/discharge partly (charge/discharge for 10% of discharge depth)	500 charge/discharge down to 1V or discharge limit voltage	500 charge/discharge down to 3.0V (100% discharge depth)	

COMPARISON BETWEEN BR AND CR

MODEL	BR vs. CR
PERFORMANCE	Discharge capacity
	BR = CR
	Voltage during discharging
	BR < CR (Higher)
	Flatness of discharge voltage
	(Flatter) BR > CR
STORAGE PROPERTIES	Load characteristics
	BR < CR (Superior)
	Storage properties (self-discharge)
	(Less self-discharge) BR ≥ CR
< 60°C	(Less self-discharge & stable) BR > CR

NOTES: In terms of their characteristics, the CR series provides a slightly higher voltage during discharge than the BR series. BR batteries, compared with CR batteries, show more stable characteristics with less discharge voltage variations. These characteristics should be taken into consideration when selecting a battery for each application.

APPLICATIONS

PRIMARY TYPE		COIN TYPE		CYLINDRICAL TYPE		PIN TYPE

SELECTING A BATTERY/MODEL NUMBER

SELECTING A BATTERY

The steps for selecting the batteries for the power supplies of specific equipment are summarized below.

PREPARATION OF REQUIRED SPECIFICATIONS (DRAFT)

The required specifications (draft) are studied by checking the requirements for the batteries to be used as the power supplies of the specific equipment and their conditions against the battery selection standards. The technical requirements for battery selection are shown in the table below for reference purposes.

SELECTION OF A BATTERY

Select several candidate batteries by referring to the catalogs and data sheets of batteries which are currently manufactured and marketed. From this short list, select the battery which will best meet the ideal level of the requirements. In actual practice, however, the 'perfect' battery is seldom found by this method; instead, the basic procedure followed should be to examine the possibility of finding a compromise or partial compromise with the required specifications (draft) and then make a selection under the revised requirements from the batteries currently manufactured and marketed. Such a procedure enables batteries to be selected more economically. Questions and queries arising at this stage should be directed to our battery engineers. Sometimes, although it may not be shown in the catalogue, the appropriate battery has become available through recent development or improvement. As a rule, the required specifications are finalized at this stage.

REQUESTS FOR DEVELOPING OR IMPROVING BATTERIES

If the battery that meets the essential and specific requirements cannot be found through the selection process described above, a request for battery development or improvement should be made to our technical department. A request like this should be coordinated as early as possible to allow for a sufficient study period. While this period depends on the nature of the request and the difficulties involved, a lead time of at least 6 to 12 months is usually required.

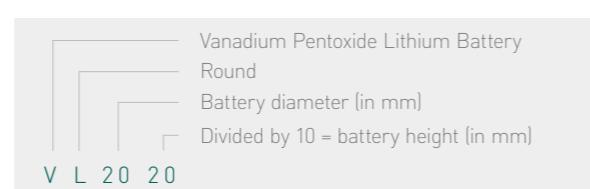

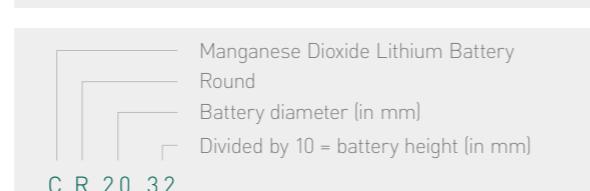

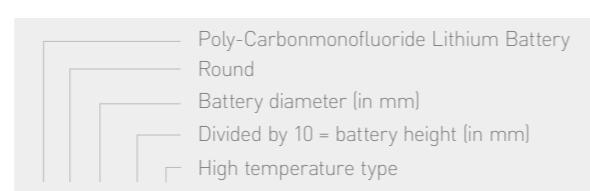

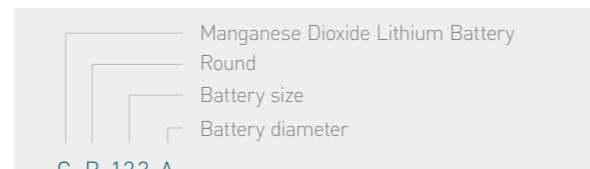

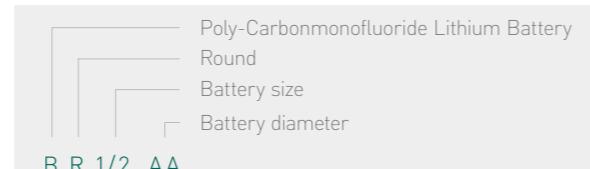

MODEL NUMBER

HOW TO INTERPRET THE MODEL NUMBERS GENERALLY USED FOR COIN TYPE LITHIUM BATTERIES

The model numbers are normally indicated using two upper-case English letters and a figure consisting of three or more digits as shown in the example below. This numbering system is supported by the Japan International Standard Committee of Clocks and Watches and is also an established practice in Japan.

B R	2 3	2 5	Battery type Round	In accordance with JIS and IEC standards
			Diameter	Integers omitting fractions (ex. 23mm Dia.)
			Height	Figures to first decimal place with decimal point omitted (ex. 2.5mm)

EXAMPLES

SELECTING A BATTERY/MODEL NUMBER

TECHNICAL CONDITIONS FOR SELECTING BATTERIES

GENERAL SAFETY PRECAUTIONS FOR USING, HANDLING AND DESIGNING

APPLICABLE BOTH PRIMARY AND SECONDARY BATTERIES

CLASSIFICATION	ITEM	PRECAUTION
BATTERIES	VOLTAGE MEASUREMENT	To measure the battery voltage, use an instrument with an input resistance of 10MΩ or higher.
	INTERNAL RESISTANCE MEASUREMENT	To measure the internal resistance, use a 1,000Hz AC instrument.
	ELECTRICAL CHARACTERISTICS CHECK	Even minimal shorting causes the battery voltage to drop, requiring a period of time for the voltage to recover. Checking the voltage characteristics before the voltage has sufficiently recovered in such a situation may result in a misjudgment of battery voltage.
	CLEANING	Prior to installation in the equipment, wipe the batteries and equipment terminals clean using a dry cloth, etc.
	WASHING AND DRYING	<ul style="list-style-type: none"> Washing: Use of a conductive detergent causes batteries to discharge, the battery voltage to drop and the battery performance to deteriorate in other ways. Be sure to use a non-conductive detergent. Drying: The heat produced when the temperature of the battery units rises above 85°C deforms the gaskets and causes electrolyte leakage and a deterioration in performance. Be sure to dry batteries only for short periods of time at temperatures below 85°C.
	MOUNTING	<ul style="list-style-type: none"> Ensure that dust and other foreign substance will not cause shorting between the poles. When handling batteries, wear finger covers or gloves made of rubber, cotton, etc. to protect the batteries from dirt.
	UL	Strictly comply with the conditions outlined on the next page.
	USE OF MULTIPLE BATTERIES	Give sufficient consideration to safety in design when a multiple number of batteries are to be used. Consult with Panasonic concerning packs of multiple batteries.
	SIMULTANEOUS USE OF OTHER TYPES OF BATTERIES	When other types of batteries are also to be used in the same equipment, design the circuitry in such a way that the current (leakage current) from the other batteries will not flow to the lithium batteries. (This applies to primary batteries.)
	USE OF BATTERIES IN SERIES OR IN PARALLEL	This requires special circuitry: Please consult with Panasonic. Do not use lithium batteries together with different types of batteries in series or in parallel.
DESIGN	STORAGE	Recommended storage conditions: T: +5-35°C, RH: 45-85% (non-condensing) Maximum storage period: 10 years (7 years for CR cylindrical consumer cells)
	BATTERY LIFE	Prior to installation in the equipment, wipe the batteries and equipment terminals clean using a dry cloth, etc.
	BATTERY COMPARTMENTS IN EQUIPMENT	<ul style="list-style-type: none"> Ensure that the batteries can be replaced easily and that they will not fall out of position. Give consideration to the battery dimensions, tolerances, etc. Give consideration to the shape of \oplus and \ominus electrodes of the batteries and their tolerances to prevent installation in reverse. Clearly indicate on the battery compartment the type of batteries to be used and their correct installation direction (polarities). Limit the electrical circuits inside the battery compartment only to the circuits relating to the battery contacts. With the exception of the terminal areas, insulate the battery compartment from the electrical circuits. Take steps to minimize any damage to the equipment resulting from electrolyte leakage from the battery compartment. Batteries should be free from leakage of liquids, which can damage equipment and spoil the contact at terminals, making the operation of equipment unstable.
	BATTERY LAYOUT AND CONSTRUCTION AND MATERIALS OF COMPARTMENT	<ul style="list-style-type: none"> Take steps to ensure the batteries are not located near heat generating component in the equipment. Installing batteries near a heat source will heat up the batteries, causing thermal deformation of the gasket and resulting in electrolyte leakage and a deterioration in characteristics. Adopt a construction which allows the gases to be vented. Give consideration to the impact and the effect on the environment in selecting the materials to be used.

GENERAL SAFETY PRECAUTIONS FOR USING, HANDLING AND DESIGNING

CLASSIFICATION	ITEM	PRECAUTION
CONTACTS AND CONNECTION TERMINALS	CONTACT POINT MATERIALS	Use nickel-plated iron or nickel-plated stainless steel for the contact points.
	CONTACT PRESSURE OF CONTACTS	In order to ensure stable contact, use the following levels of contact as a general guideline: 5N to 15N for cylindrical types 2N to 10N for coin types.
	SHAPE OF TERMINALS	Use of Y-shaped terminals (2-point contact) for both the \oplus and \ominus electrodes yield stable contact.
	CONNECTION TERMINALS	If lead wires and connection terminals such as tab terminals are required for the batteries, consult with Panasonic since we offer a range of external terminals (connectors, etc.).
NOTES	CIRCUIT DESIGN	<p>1. Shorting causes the battery voltage to drop to about 0V before slowly recovering from the open state. It takes time for the initial voltage to be restored. Notice that measuring the open-circuit voltage immediately after shorting may lead to a misjudgment that the battery is abnormal. The figure on the right illustrates how voltage recovers after shorting.</p> <p>2. Reverse current preventing diodes. Since lithium primary batteries are not rechargeable, use of a reverse current preventing diode and a protective resistor in series is required where there is the possibility of charging in the equipment circuit. Use a silicon diode or Schottky diode with a low reverse current as the reverse current preventing diode. To maintain the characteristics of a coin type lithium battery, the total charging amount of the battery during its total usage period must be kept within 3% of the nominal capacity of the battery.</p>  <p>The graph shows two plots of Voltage (V) vs Recovery time (hours). The top plot is for Temperature: 20°C with shorting times of 3.5, 10, and 20 seconds. The bottom plot is for Temperature: 20°C with shorting times of 3.5, 10, and 20 seconds. Both plots show a sharp drop in voltage to near 0V at t=0, followed by a slow recovery towards the initial value of approximately 3.2V.</p>  <p>(A) 2-cell 6V usage: A single battery cell connected to an IC through a diode and a resistor. The resistor is connected to ground.</p> <p>(B) Parallel usage: Two battery cells connected in parallel to an IC through a diode and a resistor. The resistor is connected to ground.</p> <p>(C) UL conditions: Two battery cells connected in parallel to an IC through a diode and a resistor. The resistor is connected to ground.</p>

GENERAL SAFETY PRECAUTIONS FOR USING, HANDLING AND DESIGNING

PRIMARY BATTERIES

Since lithium primary batteries are not rechargeable, use a reverse current blocking diode and a protective resistor in series where there is the possibility of charging in the equipment circuit.

REVERSE CURRENT BLOCKING DIODE DIODE USED

Use a low leak current diode (this current varies with temperature).

SELECTION STANDARD

The total allowable charging amount of a battery during its total usage period must not be greater than 3% of the nominal capacity of the battery for a coin type battery or 1% for a cylindrical battery.

EXAMPLE

When a CR-2477 (1,000mAh) coin type battery is to be used for 5 years, a reverse current preventing diode with a reverse current of 0.7 μ A or less is required.

CALCULATION METHOD

$$\begin{aligned} 1,000 \text{mAh} [\text{CR-2477}] \times 3\% [\text{coin type battery}] &= \leq 30 \text{mAh} \\ 30 \text{mAh} \div \text{usage period} [5 \text{years} \times 365 \text{days} \times 24 \text{hours}] &= 0.7 \mu\text{A} \end{aligned}$$

USE OF PROTECTIVE RESISTOR IN SERIES: SELECTION AND INSTALLATION (UL STANDARD)

A resistor must be installed in series with the battery to limit the charge current which will flow to the battery in case of destruction in continuity of the reverse current preventing diode. The maximum allowable current is specified for each battery size in the table at the right, and the resistance value of the protective resistor is determined as:

$$R > V \div I$$

(where 'I' is the maximum allowable charge current specified by UL).

CONDITIONS FOR UL STANDARD
(Contact Panasonic for further details.)

1. USE OF PROTECTIVE RESISTOR IN SERIES

SELECTION

Select the protective resistor in such a way that the charge current which will flow to the battery when the diode is destroyed is less than the value given in the table on the next page.

INSTALLATION

To protect the battery from being charged in the event of the destruction of the diode, install a protective resistor in series with the battery.

2. BATTERY REPLACEMENT

REPLACEMENT BY QUALIFIED ENGINEER

These batteries are intended for use as a part of an electrical circuit in equipment and any battery with an asterisk '*' in the table on the next page should only be replaced by a qualified engineer.

REPLACEMENT BY USER

Those lithium batteries which are not accompanied by an asterisk '*' in the table on the next page and which include the use of up to four of them in series or in parallel may be replaced by users provided that the conditions specified by the UL Standard are met.

USE IN SERIES OR IN PARALLEL

In replacing up to four batteries, the batteries must all be replaced with new ones at the same time. Set the maximum allowable charge current to within the current permitted by the number of batteries in series or in parallel.

SECONDARY BATTERIES

USE OF MULTIPLE BATTERIES

Consult with Panasonic if two or more Vanadium rechargeable Lithium batteries (VL series) or Manganese rechargeable Lithium batteries (ML series) are to be used in series or in parallel.

CHARGING

Details on the charge voltage, charge current and charge circuit are given for each type of battery.

CONDITIONS OF UL APPROVAL

The maximum charge current must be restricted to 300mA when protective components have been subjected to short- or open-circuiting.

DESIGN FOR MEMORY BACK-UP USE

SELECTING BATTERIES

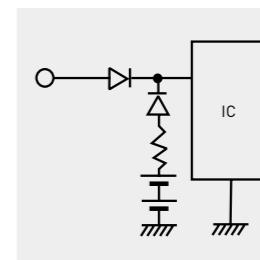

When selecting batteries, give consideration to such factors as the current consumption of the equipment in which the batteries are to be used, the expected life of the batteries, and temperature in the operating environment. At low operating environment temperatures, the consumption current of the ICs drops but the discharge voltage of the batteries will also decrease. Also it is important to note that the capacity deterioration of batteries in long-term use becomes significant at high operating environment temperatures.

MEMORY BACK-UP CIRCUIT AND HOLDING VOLTAGE

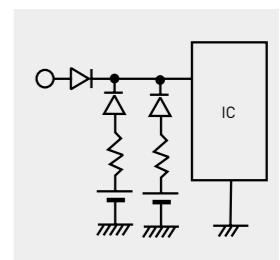

The circuit typically used for memory back-up is shown in the figure on the right. The memory holding voltage is expressed as: $V_B - V_F - I_F \times R > \text{memory holding voltage of IC}$.

(A) 2-CELL 6V USAGE

Lithium batteries.

POLY-CARBONMONOFLUORIDE LITHIUM BATTERIES (BR SERIES) - CYLINDRICAL TYPE

Our Panasonic Poly-Carbonmonofluoride Lithium batteries (BR series) are ideal for applications such as meters or smoke detectors which demand either long-term power supply reliability or need to handle a wide temperature range.

FEATURES

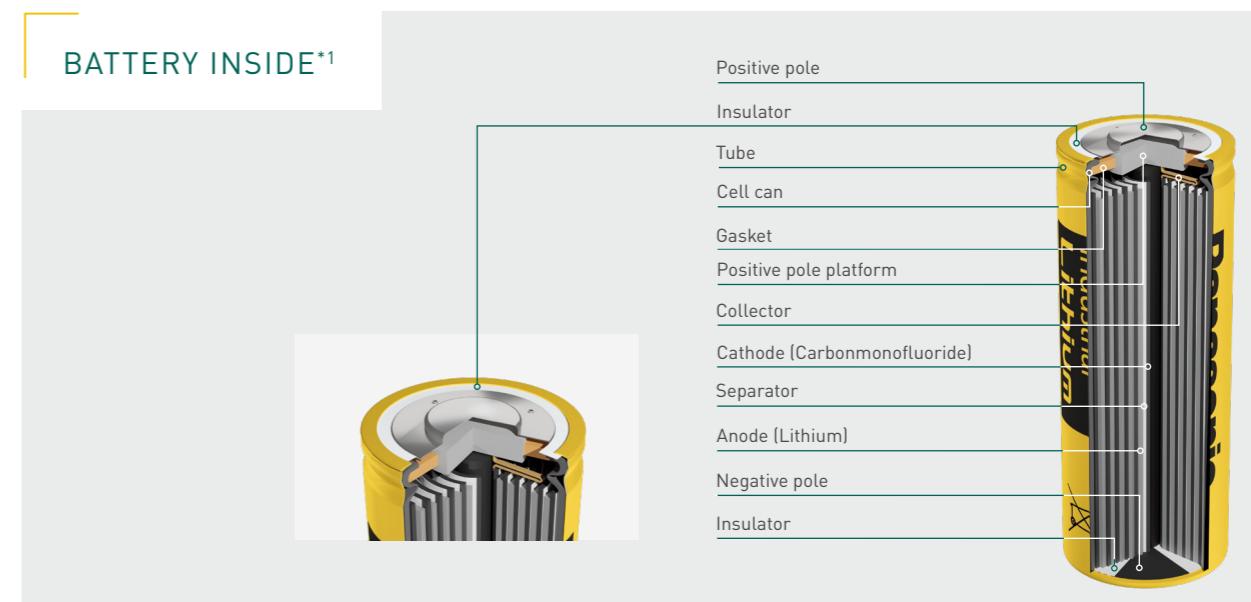

- | Operating temperature range: between -40°C ~ +85°C
- | Self-discharge rate at 20°C is less than 0.5% per year
- | Superior long-term reliability
- | Over 40 years of experience in production

(CR SERIES FOR CONSUMER) – CYLINDRICAL TYPE

Panasonic Lithium CR type cylindrical batteries come as either single cells or dual cell packs. All cylindrical type Manganese Dioxide (CR series) Lithium batteries feature a spiral structure. With their enlarged electrode surface areas, they permit a current as high as several amperes to be drawn. In addition these batteries are convenient for equipments which are considered to replace the battery at the field.

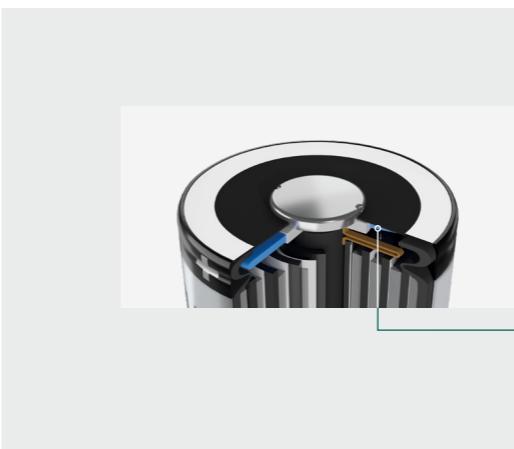

APPLICATIONS

FEATURES

- Operating temperature range: between -40°C ~ +70°C*¹
- Good pulse discharge capability
- Stable operation voltage
- Self-discharge rate at 20°C is just 1% per year

POLY-CARBONMONOFLUORIDE LITHIUM BATTERIES (BR SERIES) - COIN TYPE

(NON-RECHARGEABLE)

Panasonic Lithium BR coin type batteries feature high energy density, and were developed and commercialized using Panasonic's extensive experience in battery technology. They exhibit stable performance under high ambient temperatures.

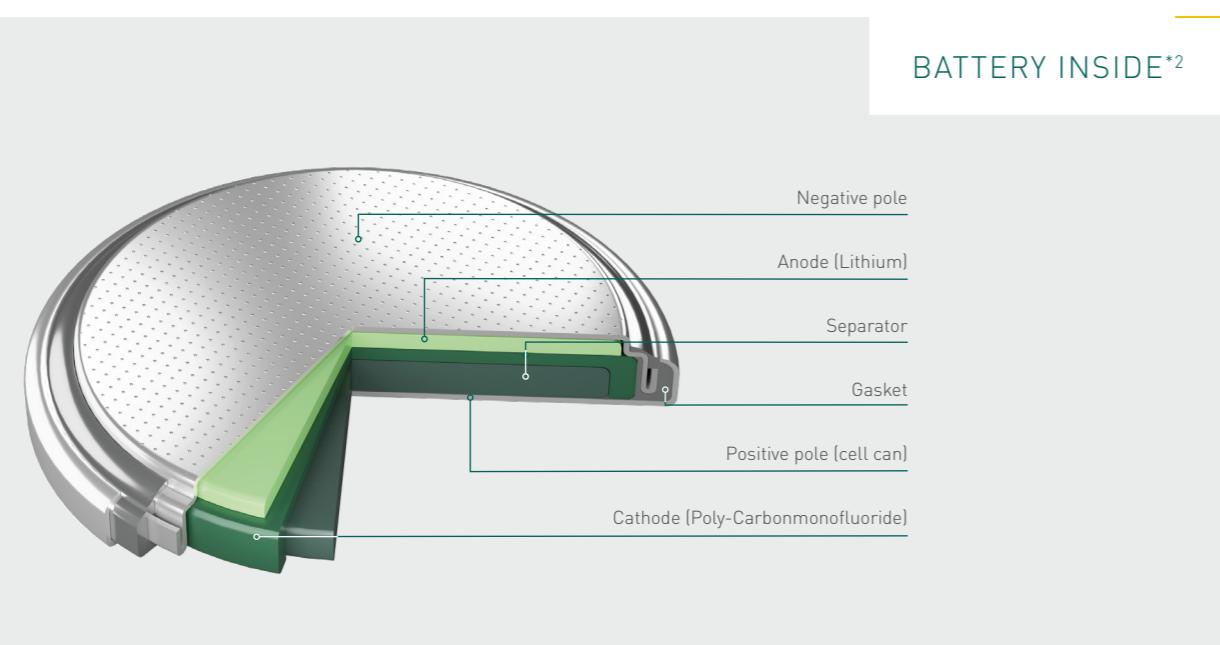

FEATURES

- Self-discharge rate at 20°C is less than 1.0% per year
- Wide operating temperature range: between -30°C ~ +85°C
- Superior long-term reliability
- Over 44 years of experience in production

HIGH OPERATING TEMPERATURE POLY-CARBONMONOFLUORIDE LITHIUM BATTERIES (BR-A SERIES) – COIN TYPE (NON-RECHARGEABLE)

The high energy density and the special material for gasket and separator make this battery series the ideal power supply in high ambient temperature applications.

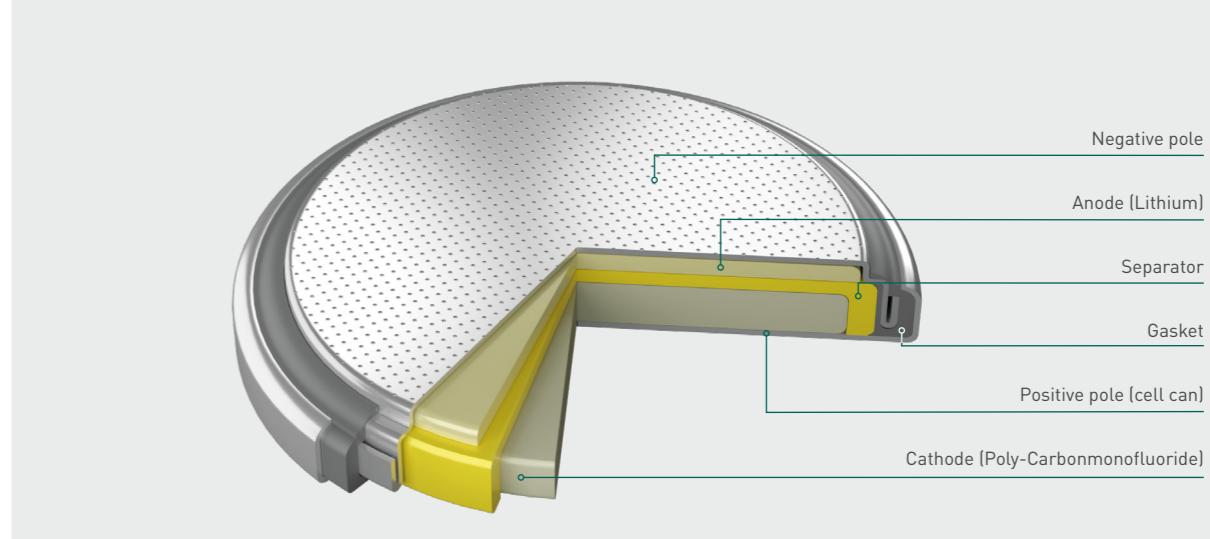

FEATURES

- | Superior design for high temperature applications (-40°C ~ +125°C)
- | Outstanding long-term reliability
- | Over 24 years of experience in production
- | Self-discharge rate at 20°C is less than 0.5% per year

APPLICATIONS

- Tire Pressure Monitoring Systems (TPMS)
- Electronic Toll Collection (ETC)
- Heat cost allocators, etc.

MANGANESE DIOXIDE LITHIUM BATTERIES
(CR SERIES) – COIN TYPE
(NON-RECHARGEABLE)

These batteries have a proven track record of excellence in equipment requiring high currents. Additionally Panasonic has many years of manufacturing experience with this battery technology.

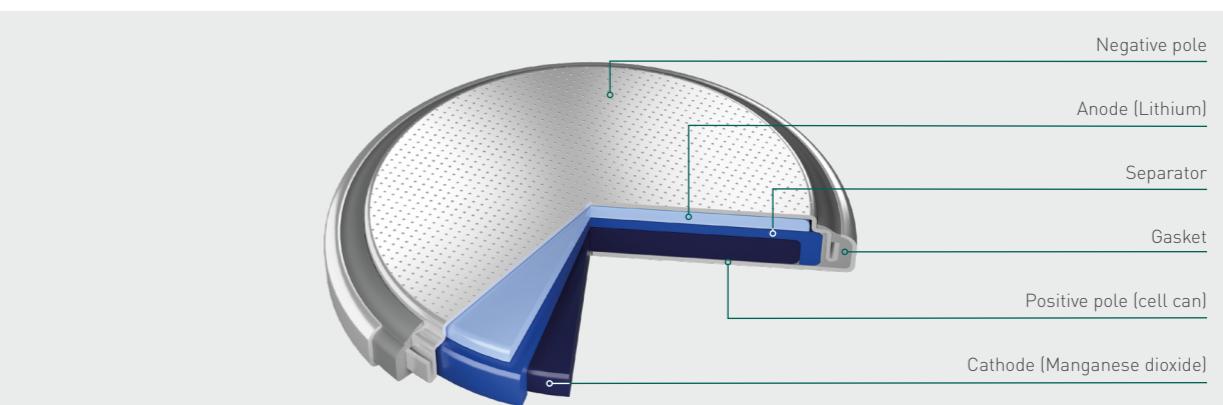

FEATURES

- | Good pulse capability
- | Stable voltage level during discharge
- | Long-term reliability
- | Self-discharge rate at 20°C is just 1.0% per year
- | Temperature range: -30°C ~ +85°C¹

LITHIUM BATTERY HOLDERS FOR BR-203

These battery holders are designed for sure and easy loading/removal of Panasonic coin type Lithium batteries in/from equipment enabling the batteries to fully exploit their capabilities as the back-up power supply in C-MOS RAM memory and microcomputer memory. All of the battery holders are designed to prevent inverted insertion of the battery.

PRECAUTION FOR WASHING BATTERY HOLDERS

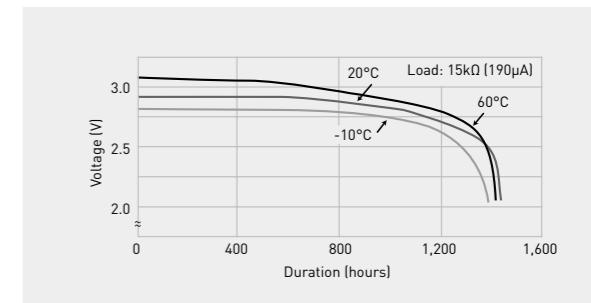

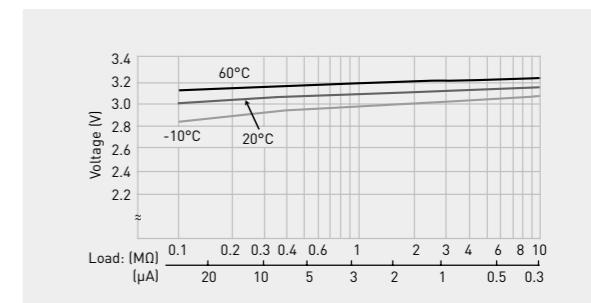

The battery holders can be adversely affected by some detergents use in the circuit board washing process and may result in cracks forming in the holder. Please test the holders in your washing process before use.

HIGH TEMPERATURE MANGANESE DIOXIDE LITHIUM BATTERIES (CR-A/B SERIES) - COIN TYPE
(NON-RECHARGEABLE)

Comprising key design elements of the BR-A high temperature series in combination with the benefits of the conventional CR coin series, these batteries offer the best of both worlds in a cost effective manner.

FEATURES

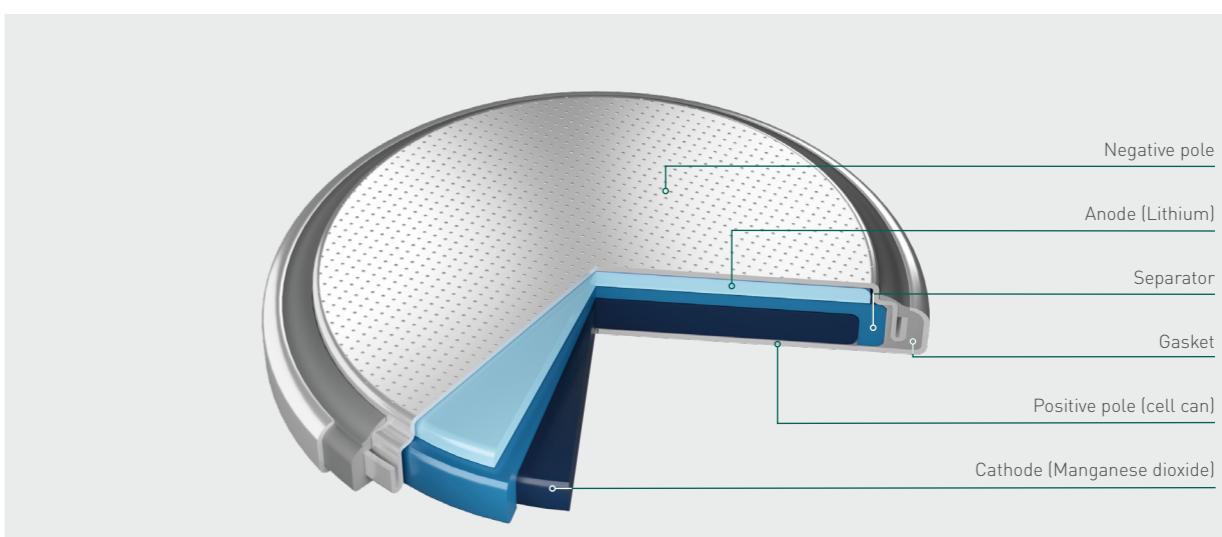

- | Excellent durability in high temperatures (up to 125°C^{*1}) allows various usages automotive electrical components and outdoor devices to be used under severe environments
- | Superior pulse discharge characteristics even at low temperatures and can be used in a wide operating temperature
- | Excellent long-term reliability enables safe and long-term use

APPLICATIONS

VANADIUM RECHARGEABLE LITHIUM BATTERIES (VL SERIES) – COIN TYPE

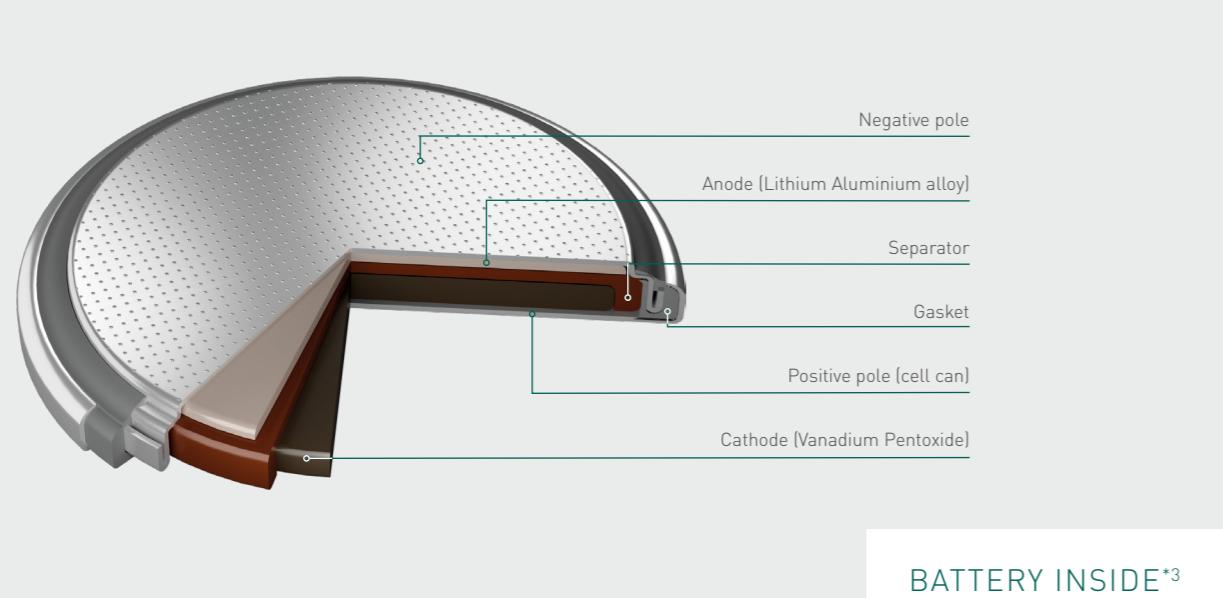

(RECHARGEABLE)

These high quality lithium coin batteries feature vanadium oxide for the positive pole, lithium alloy for the negative pole and non-aqueous solvent for the electrolyte.

FEATURES

- | Rechargeable Lithium technology
- | Self-discharge rate at 20°C is only 2.0% per year for VL and ML battery types
- | 1,000 charge-discharge cycles for VL and ML at 10% depth of discharge
- | Superior long-term reliability
- | Years of experience in production

VANADIUM RECHARGEABLE LITHIUM BATTERIES (VL SERIES)

CHARGING

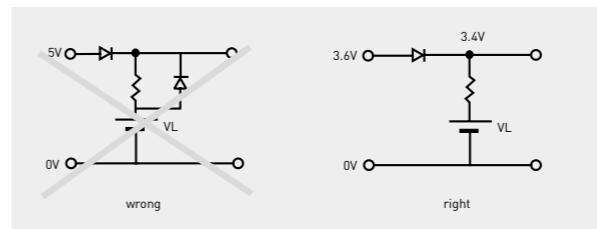

CHARGING CIRCUITS

The charging circuit is crucial in terms of ensuring that full justice will be done to the battery characteristics. Consider it carefully as the wrong charging circuit can cause trouble.

CHARGING / DISCHARGING CYCLE	Approx. 1,000 times at 10% discharge depth to nominal capacity
CHARGING SYSTEM ^{*1}	Constant-voltage charging. (Please strictly adhere to the specified charge voltage)
OPERATING TEMPERATURE	-20°C to +60°C

PRECAUTIONS REGARDING THE CHARGE VOLTAGE SETTING

Under no circumstances should constant current charging, which is used for Nickel-Cadmium batteries, be used. Ignoring this precaution will cause the battery voltage to rise to about 5V, resulting in a deterioration of performance.

CHARGE VOLTAGE RANGE

If a fixed-charging method is applied, please adhere to the specified charging voltage. The guaranteed value over an operating temperature range from -20°C to +60°C is $3.4V \pm 0.15V$. (Actual value: $3.4V \pm 0.20V$)

- | If the charging voltage exceeds the specifications, the internal resistance of the battery will rise and may cause battery deterioration. Also, with a charge voltage around 4V, corrosion of the \oplus terminal (case) may occur, causing leakage.
- | It is not possible for the battery capacity to recover completely when the charging voltage is below the specification.

RECOMMENDED CHARGING CIRCUITS

- basic conditions

Fixed-voltage charge

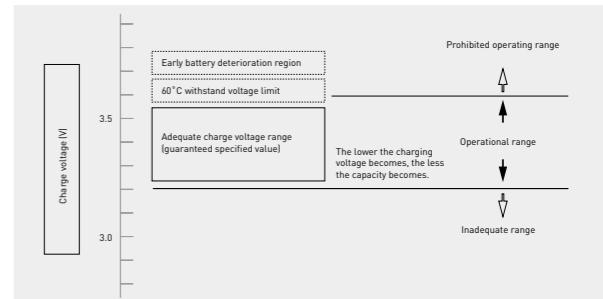

Charge voltage:	$3.4V \pm 0.15V$
Charge current:	For a battery voltage of 3V
VL-621	Approx. 0.2mA or below
VL-1220	Approx. 0.5mA or below
VL-2020	Approx. 1.5mA or below
VL-2330	Approx. 2.0mA or below
VL-3032	Approx. 4.0mA or below

(It is permissible for the current to increase beyond the above level when the battery voltage drops below 3V.)

MIXED USAGE OF BATTERIES

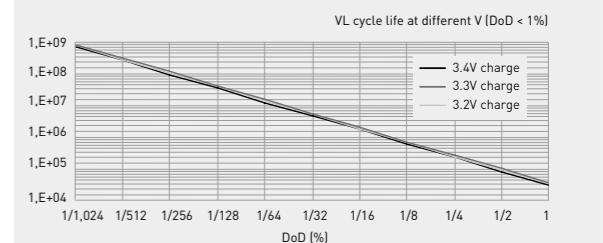

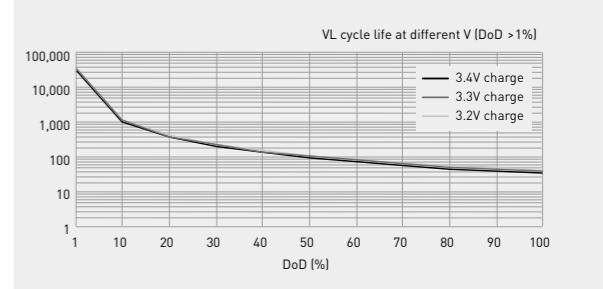

Do not use these batteries and lithium primary batteries or other rechargeable batteries together, and do not use new batteries and old batteries together even if they are of the same type.

INFLUENCE OF THE CHARGE VOLTAGE ON VL BATTERIES

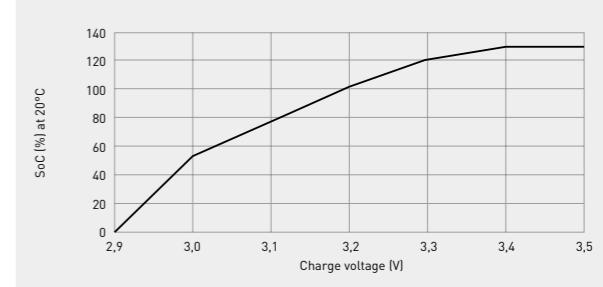

If the charge voltage goes beyond its adequate range, battery performance may deteriorate early. Be sure to observe the guaranteed charge voltage.

VL CYCLE LIFE

MANGANESE RECHARGEABLE LITHIUM BATTERIES
(ML SERIES) – COIN TYPE
(RECHARGEABLE)

These super compact rechargeable lithium batteries feature a manganese compound oxide for the positive electrode, a lithium/aluminum alloy for the negative electrode and a special non-aqueous solvent for the electrolyte. They can easily be incorporated into circuits where 3V ICs are used to save space.

FEATURES

- | Rechargeable Lithium technology
- | Self discharge rate at 20°C is only 2.0% per year
- | 1,000 charge-discharge cycles at 10% depth of discharge (DoD)
- | Superior long-term reliability
- | Over 23 years of experience in production

APPLICATIONS

- Real Time Clock (RTC)
- Tracking & RFID
- Memory back-up power supplies for mobile phones
- Pagers and other compact communications equipment, etc.

Discharging temperature range [°C]	-20 to +60
Weight [g]	2.2

DISCHARGE TEMPERATURE CHARACTERISTICS

CHARGE VOLTAGE VS. DISCHARGE CAPACITY

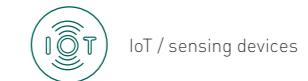

COBALT TITANIUM RECHARGEABLE LITHIUM BATTERIES (CTL SERIES) - COIN TYPE (RECHARGEABLE)

These cobalt titanium rechargeable lithium batteries have excellent cycle characteristics. Compared to MT series, CTL series can keep higher voltage[2.3V]. CTL series have long term reliability, that is why many solar watches use CTL series.

FEATURES

- | Excellent charging and discharging cycle characteristics
- | Can keep higher voltage (2.3 V) compared to MT series
- | Long term reliability that many solar watches prove

APPLICATIONS

IoT / sensing devices

Watches

MODEL NUMBER	Nominal voltage [V]	Nominal ^{*1} capacity [mAh]	Diameter [mm]	Total height [mm]	Weight [g]	Discharging temperature [°C]
CTL-621F	2.3	3.6	6.8	2.1	0.25	-20 to +60
CTL-920F	2.3	7.7	9.5	2.0	0.45	-20 to +60
CTL-1616F	2.3	13	16	1.6	1.00	-20 to +60

CHARGING

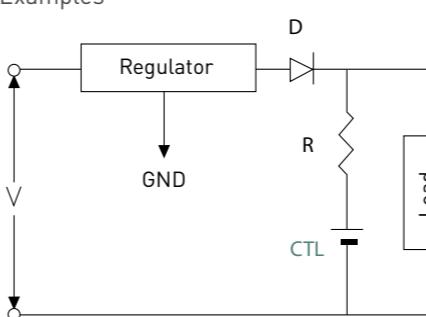

CHARGING CIRCUITS

The charging circuit is crucial in terms of ensuring that full justice will be done to the battery characteristics. Consider it carefully as the wrong charging circuit can cause trouble. Maintain the base conditions as below. Otherwise, battery quality may be damaged.

- Base conditions: Constant Voltage Charging
 Charge voltage: 2.5V to 2.7V
 Charge current: [CTL621F] Max. 0.63mA (at 2.5V of battery voltage)
 [CTL920F] Max. 1.0mA (at 2.5V of battery voltage)
 [CTL1616F] Max. 2.0mA (at 2.5V of battery voltage)

If you have any questions, please contact Panasonic.

TITANIUM RECHARGEABLE LITHIUM BATTERIES (MT SERIES) - COIN TYPE

(RECHARGEABLE)

These coin type manganese titanium rechargeable lithium coin batteries use a lithium-manganese complex oxide for the positive pole and a special lithium-titanium complex oxide for the negative pole. They provide a capacity which is more than 10 times that of capacitors of the same size.

FEATURES

- | Rechargeable lithium technology
- | Superior long-term reliability
- | Over 25 years of experience in production
- | 500 charge-discharge cycles up to 1V or discharge limit voltage [at 100% depth of discharge (DoD)]

MODEL NUMBER	Nominal voltage [V]	Nominal ^{*1} capacity [mAh]	Diameter [mm]	Total height [mm]	Weight [g]	Discharging temperature [°C]
MT-516	1.5	1.8	5.8	1.6	0.1	-10 to +60
MT-621	1.5	2.5	6.8	2.1	0.2	-10 to +60
MT-920	1.5	5	9.5	2.0	0.4	-10 to +60

APPLICATIONS

Main power supplies in compact products such as rechargeable watches

Memory back-up power supply for pagers, timers, etc.

TITANIUM RECHARGEABLE LITHIUM BATTERIES (MT SERIES)

CHARGING

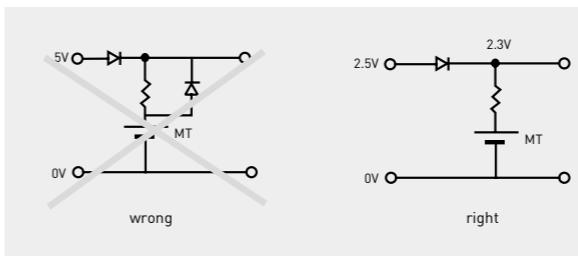

CHARGING CIRCUITS

The charging circuit is crucial in terms of ensuring that full justice will be done to the battery characteristics. Consider it carefully as the wrong charging circuit can cause trouble.

CHARGING / DISCHARGING CYCLE	Approx. 500 times at 100% discharge depth to nominal capacity
CHARGING SYSTEM ^{*1}	Constant-voltage charging. (Please strictly adhere to the specified charge voltage)
OPERATING TEMPERATURE	-10°C to +60°C

PRECAUTIONS REGARDING THE CHARGE VOLTAGE SETTING

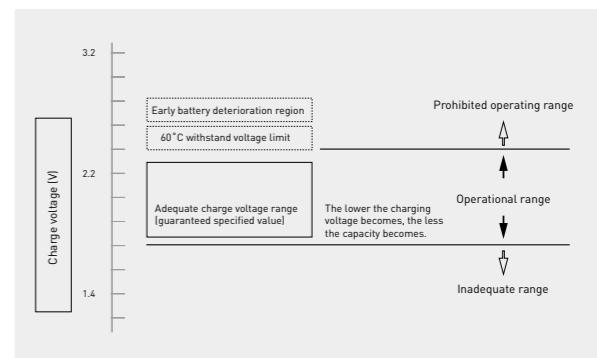

Under no circumstances should constant current charging, which is used for Nickel-Cadmium batteries, be used. Ignoring this precaution will cause the battery voltage to rise to about 5V, resulting in a deterioration of performance.

MIXED USAGE OF BATTERIES

Do not use these batteries and lithium primary batteries or other rechargeable batteries together, and do not use new batteries and old batteries together even if they are of the same type.

INFLUENCE OF THE CHARGE VOLTAGE ON MT BATTERIES

If the charge voltage goes beyond its adequate range, battery performance may deteriorate early. Be sure to observe the guaranteed charge voltage.

CHARGE VOLTAGE RANGE

If a fixed-charging method is applied, please adhere to the specified charging voltage. Guaranteed voltage is 1.8V to 2.6V at the temperature of -10°C to +60°C.

- | If the charging voltage exceeds the specifications, the internal resistance of the battery will rise and may cause battery deterioration. Also, with a charge voltage around 3V, corrosion of the \oplus terminal [case] may occur, causing leakage.
- | It is not possible for the battery capacity to recover completely when the charging voltage is below the specification.

RECOMMENDED CHARGING CIRCUITS

- basic conditions

Fixed-voltage charge

Charge voltage: 1.8 to 2.6V [Standard voltage: 2.2V]

Charge current: For a battery voltage of 2.3V

MT-516 Approx. 0.36mA or below

MT-621 Approx. 0.33mA or below

MT-920 Approx. 1.0mA or below

LITHIUM-ION RECHARGEABLE BATTERIES (CG-SERIES) - PIN TYPE

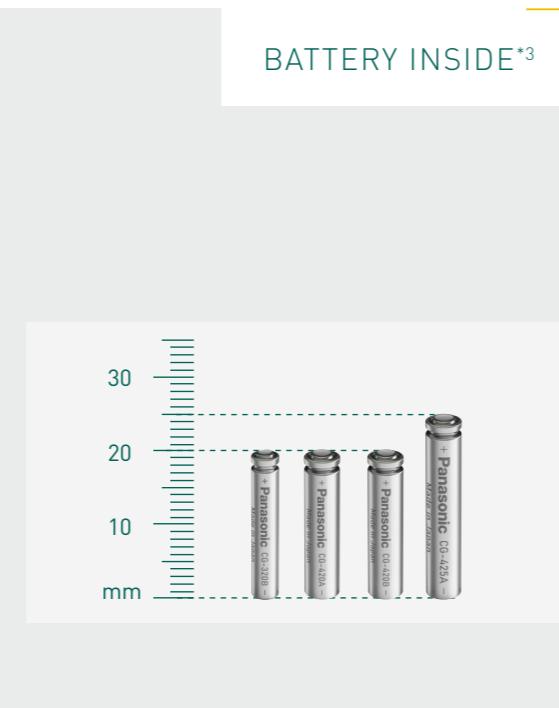

(RECHARGEABLE)

The industry's smallest-diameter cylindrical rechargeable battery has been developed using extremely fine components and materials compared to standard Lithium-ion batteries. Its outstanding technical design makes this battery ideal for wearable devices with heavy power demands. Panasonic intends to expand this new battery line-up successively to meet the requirements of next-generation mobile communication devices.

FEATURES

- Extremely small diameter pin-shaped Lithium-ion battery which expands design options for micro devices
- Rechargeable battery that can be used repeatedly and has the output capability required for near field communications
- High-strength metal exterior provides excellent reliability and robustness

LITHIUM BATTERY TERMINALS AND SOLDERING

LONG-STANDING EXPERIENCE IN HIGH QUALITY WELDING AND SOLDERING METHODS

Due to Panasonic's long experience in quality welding and soldering methods, our customers can always expect the best terminal solution for their application. Our comprehensive line-up of different terminal types covers nearly every requirement – and custom-made solutions are possible as well.

MORE INFORMATION

on the following pages or visit our product page and get detailed information about Lithium batteries.

LITHIUM BATTERY TERMINALS AND SOLDERING

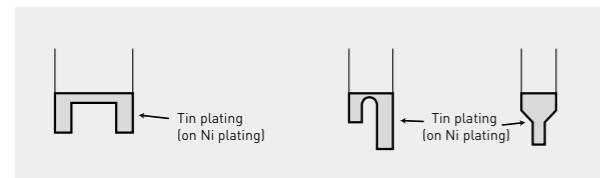

BATTERY TERMINALS

TERMINAL WELDING

For terminal welding on the battery, it is quite important to establish the best welding method and its best conditions in order to keep the strong weld strength without any damages on the battery performances. Panasonic mainly use the Laser welding method which is applicable to attach terminals on even quite small batteries that the spot welding hardly to do for. Therefore, our products can correspond exactly and flexibly to various applications. Also, we have established our own high reliable welding capability with a lot of amount of testing data to search the best weld condition for each various combinations of various battery sizes and terminal shapes, which can be provided for widespread equipments and devices.

SOLDERING ON PCB

On the edge of all terminal, tin plating is applied for increasing the reliability of soldering instead of the solder plate in order to consider influences on environments.

COMPLETE LINE-UP

Panasonic offers a full range of batteries with terminals for various PCB mounting. Since the terminals come in a variety types, please contact Panasonic for further details. On the other hand, we also provide battery holders for some limited sizes.

SOLDERING LITHIUM BATTERIES

USING A SOLDERING IRON

Do not allow the soldering iron to make direct contact with the bodies of the batteries. Proceed with the soldering quickly within 5 seconds while maintaining the iron tip temperature at about 350°C, and do not allow the temperature of the battery bodies to exceed 85°C (heat resistance BR type is 125°C).

AUTOMATIC DIP-SOLDERING BATH

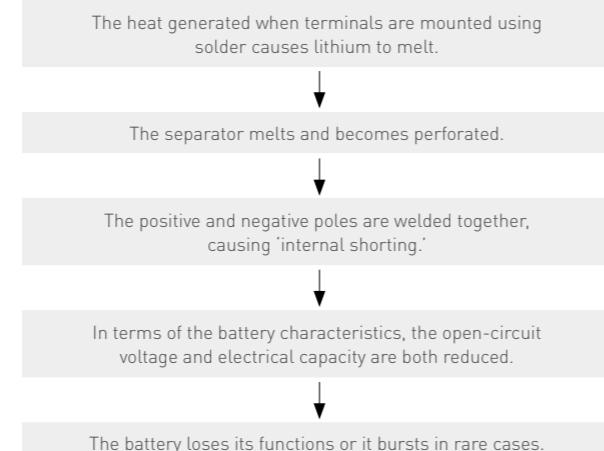

Soldering with a dip-soldering bath can be used by condition but do not allow the temperature of the battery bodies exceed 85°C. It is important to note, depending on the temperature conditions inside the dipping device, that the battery body temperature may rise after dipping due to the residual heat retained. When a post-dipping temperature rise is observed, review the temperature conditions and consider a dipping time reduction or a way of forcibly cooling the batteries after dipping.

BASIC CONDITIONS

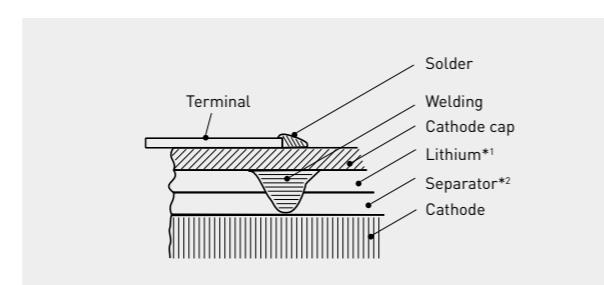

SOLDER DIPPING BATH TEMPERATURE	Not exceed 260°C
DIPPING DURATION	Within 5 sec.
NUMBER OF DIPPING	Within 2 times

CAUTIONS

Example where the terminals were soldered straight onto a coin type lithium battery, the terminals were connected to a PC board or other electronic components, and the heat generated by the soldering adversely affected the battery, resulting in a deterioration of the battery characteristics:

SOLDERING

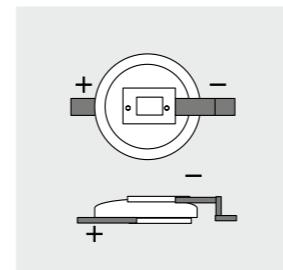

LITHIUM BATTERY TERMINALS AND SOLDERING

TERMINAL TYPES

Panasonic offers a broad range of different tabs for our Lithium batteries in order to meet all customer needs. In addition tailor made solutions are possible as well.

STANDARDS AND REGULATIONS

PRODUCT CERTIFICATIONS

UL APPROVED BATTERIES

All our Lithium batteries are in compliance with UL 1642 (primary and secondary lithium batteries) - file number MH 12210. These requirements cover lithium batteries intended for use in technician-replaceable or user-replaceable applications.

FACTORY CERTIFICATIONS

All our production sites are ISO 9001 und ISO 14001 certified. Moriguchi, Japan and Jakarta, Indonesia sites are additionally certified towards IATF 16949. Moriguchi, Japan is also certified according to OHSAS 18001.

APPLICABLE STANDARDS

IEC 60086-1

Standardization of primary batteries with respect to their electrochemical system, dimensions, nomenclature, terminal configurations, markings, test methods, typical performance, safety and environmental aspects.

APPLICABLE PRODUCTS IN THIS CATALOGUE:

BR-2/3A [BR17335], BR-2/3AG [BR17335], CR-2 [CR15H270], CR-123A [CR17345], 2CR-5 [2CR5], CR-P2 [CRP2], BR-1225 [BR1225], BR-2325 [BR2325], CR-1025 [CR1025], CR-1216 [CR1216], CR-1220 [CR1220], CR-1616 [CR-1616], CR-1620 [CR1620], CR-2012 [CR2012], CR-2016 [CR2016], CR-2025 [CR2025], CR-2032 [CR2032], CR-2330 [CR2330], CR-2354 [CR2354], CR-2450 [CR2450], CR-3032 [CR3032]

IEC 60086-2

Complements the general information and requirements of IEC 60086-1.

IEC 60086-3

Specifies dimensions, designation, methods of tests and requirements for primary batteries for watches.

APPLICABLE PRODUCTS IN THIS CATALOGUE:

BR-1225 [BR1225], BR-2325 [BR2325], CR-1025 [CR1025], CR-1216 [CR1216], CR-1220 [CR1220], CR-1616 [CR-1616], CR-1620 [CR1620], CR-2012 [CR2012], CR-2016 [CR2016], CR-2025 [CR2025], CR-2032 [CR2032], CR-2330 [CR2330], CR-2354 [CR2354], CR-2450 [CR2450]

IEC 60086-4

Requirements for primary lithium batteries to ensure their safe operation under intended use and reasonably foreseeable misuse.

Applicable products in this catalogue: BR, CR

Although not mandatory, Panasonic is progressing third party test certification aka CB-scheme according to this standard.

For several battery types in this catalogue, such a report is available on request.

IEC 62133-2

Requirements and tests for the safe operation of portable sealed secondary lithium cells and batteries containing non-acid electrolyte, under intended use and reasonably foreseeable misuse.

Applicable products in this catalogue: CG

LITHIUM BATTERY TRANSPORTATION

The transportation of lithium batteries is regulated by the International Air Transport Association (IATA), the International Civil Aviation Organization (ICAO) and Accord européen relatif au transport international des marchandises Dangereuses par Route (ADR).

All batteries are approved in accordance to UN Spezial Provision SP 188 Manual of Tests & Criteria Part III Subsection 38.3.

Transport test related to UN 38.3 reports are available on request.

TRANSPORT BY ROAD/RAIL

UN 3090 takes place under ADR/RID 2019

TRANSPORT BY SEA

UN 3090 takes place under IMDG Code 2019

TRANSPORT BY AIR

UN 3090 takes place under IATA DGR 2020 61st Edition

SECURITY EXPORT CONTROL

'Security export control' entails observing the legislation provided to maintain international peace and safety by preventing the proliferation of weapons of massive destructions (nuclear weapons, chemical warfare weapons, biological weapons and missiles) and the excessive buildup of conventional weapons. COCOM, the committee that imposed controls on exports to the Communist bloc, was disbanded on March 31, 1994. Later, as part of a new export control regime, Russia and Eastern European countries joined with the previously affiliated nations of COCOM (Japan, America and Europe) and established the Wassenaar Arrangement for dual-use goods & technologies related to conventional weapons. According to the Export Trade Control Order revised by the Japanese Ministry of Economy, Trade & Industry in May 2008, batteries listed in this catalogue are classified as 'batteries' not 'cells', and will therefore not be controlled by [7] in annex table 1 to the order. The above notwithstanding, these batteries may be subject to the regulations depending on their ultimate destination, application and other conditions.

According to the Export Trade Control Order revised by the Japanese Ministry of Economy, Trade & Industry in May 2008, batteries listed in this catalogue are classified as 'batteries' not 'cells', and will therefore not be controlled by [7] in annex table 1 to the order. The above notwithstanding, these batteries may be subject to the regulations depending on their ultimate destination, application and other conditions.

When a certificate of classification is required for exportation, etc. or if you have any queries, contact a Panasonic sales representative.

AVOIDING HAZARDS

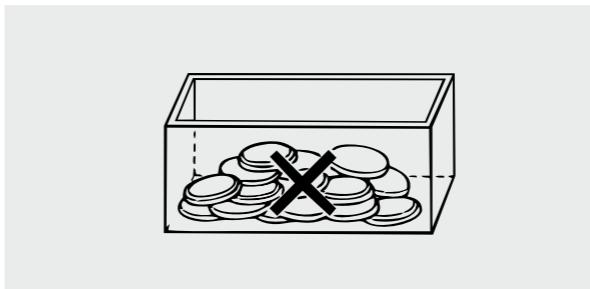

CASE STUDY AND EXPLANATION

To store batteries, place each of the batteries in the sections provided on the designated tray in such a way that they will not make contact with one another.

IGNITION

2,000 new batteries were taken out from the 20-piece tray containers and thrown randomly into a cardboard box where they were stacked on top of one another. About 30 minutes later, smoke was seen emanating from the batteries followed by ignition several minutes after that.

CASE STUDY: Ignition of batteries stacked together

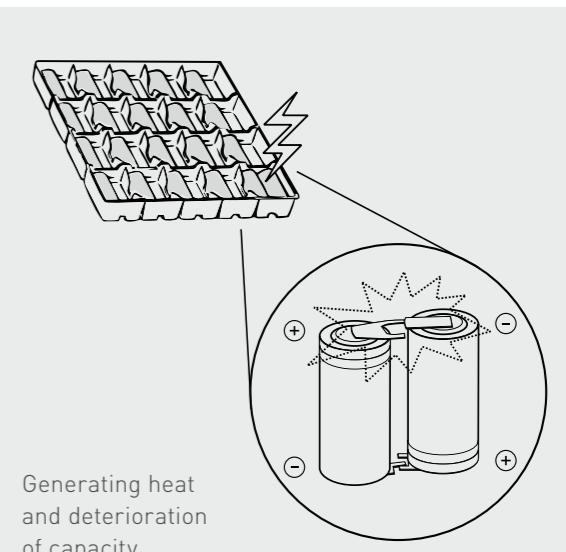

RUPTURE

This particular case involves batteries which were packed in trays and destined for OEMs. The batteries were packed in an intermediate package consisting of 10 trays with each tray containing 20 (or 40) batteries, and the trays were stacked on top of each other. The intermediate package (of the 10 trays) was opened at the distribution stage of our operations, and five of the trays were delivered to one customer. Since the trays were stored at an angle inside the box, the batteries fell out of their positions on the trays and became stacked up on the bottom inside the small box. As a result, some of the batteries burst.

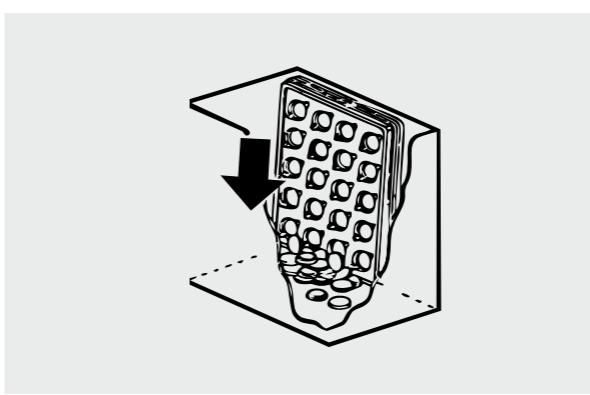

GENERATING HEAT

21 cylindrical type lithium batteries with tab terminals were placed in a 20-piece tray – one battery more than the capacity of the 20-piece tray. Two of the batteries were placed together with their poles reversed. As a result, the tab terminals came into contact with each other, causing external shorting, and the temperature of the two batteries rose dramatically, generating heat and causing the tubes to burst.

Since two batteries were placed in a space (indicated by the arrow) allocated to one battery, their terminals made contact with each other, and external shorting resulted.

To store batteries, place each of the batteries in the sections provided on the designated tray in such a way that they will not make contact with one another.

CASE STUDY: Bursting of batteries stacked on top of one another

PREVENTING QUALITY PROBLEMS

REDUCTION OF BATTERY VOLTAGE AND DETERIORATION OF CAPACITY

REDUCTION OF BATTERY VOLTAGE AND DETERIORATION OF CAPACITY THROUGH CONTACT WITH ANTISTATIC CONDUCTIVE MATERIALS

Incidents have been reported where terminal-mounted batteries for memory back-up or coin type lithium batteries have come into contact with anti-static conductive materials, thus forming external discharge circuits and leading to voltage drops or capacity deterioration.

In manufacturing plants using ICs, LSI and other semiconductor components, thoroughgoing antistatic measures are taken. Various protective materials are used to prevent static: most of them have special compounds of carbon, aluminum foil and other metals and are therefore conductive. These protective materials are used, for example, in the form of packaging bags, trays, mats, sheets, films, corrugated boards and resin cases.

FIG. 1 A terminal-mounted battery was inserted into a conductive mat. The battery charge was exhausted in several days.

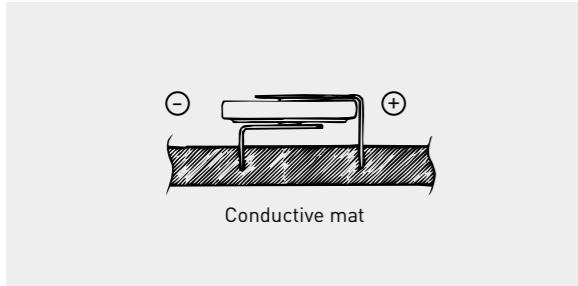

FIG. 2 Battery-mounted PC boards were inadvertently brought into contact with spacers and a conductive rubber sheet. The battery charge was exhausted.

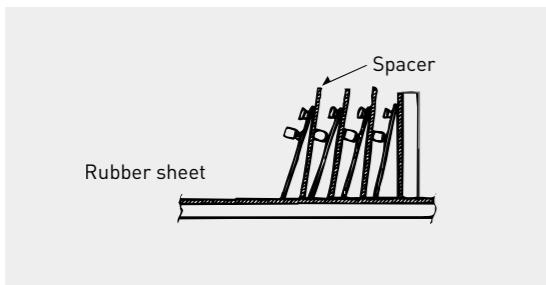

FIG. 3 A battery-mounted PC board was inadvertently brought into contact with a conductive resin case. The battery charge was exhausted.

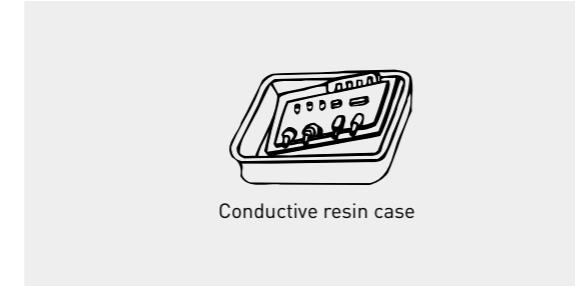

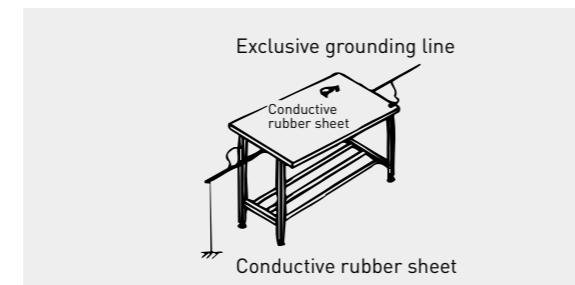

FIG. 4 A battery was placed directly on a rubber sheet spread over a worktable. The + and - terminals were in contact with the sheet and the battery charge was exhausted.

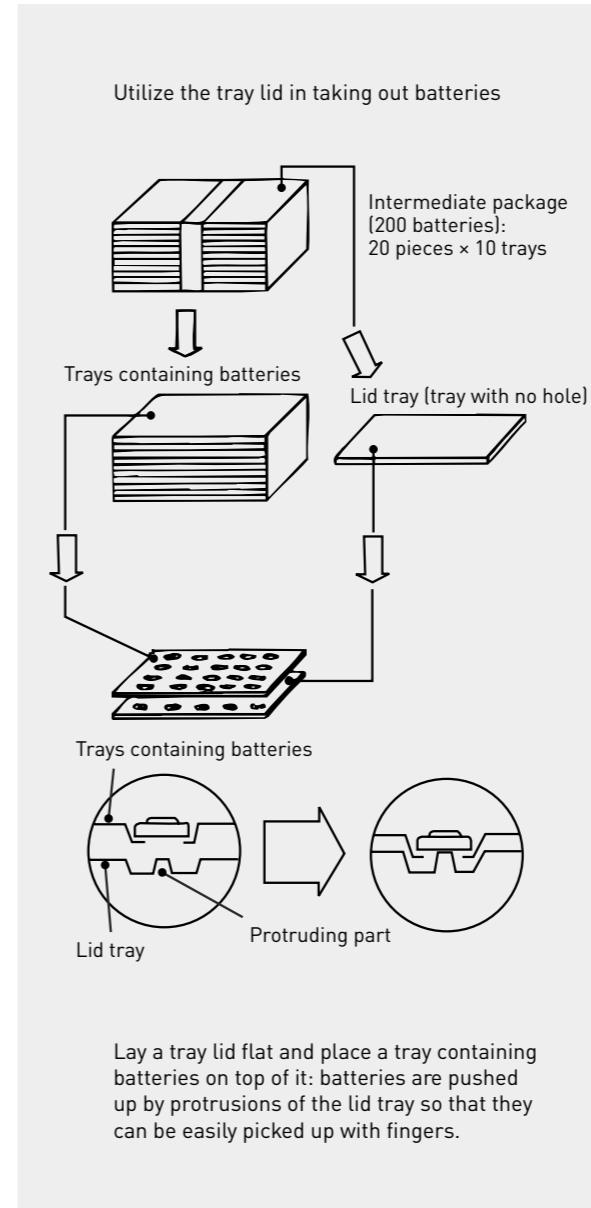

PREVENTING QUALITY PROBLEMS

REDUCTION OF BATTERY VOLTAGE AND DETERIORATION OF CAPACITY THROUGH CONTACT BETWEEN BATTERIES

Incidents have been reported where terminal-mounted batteries for memory back-up or coin type lithium batteries have come into contact each other, thus forming discharge circuits (shorted state) and leading to voltage drops or capacity deterioration. Observe the following precautions.

RECOMMENDED PROCEDURES

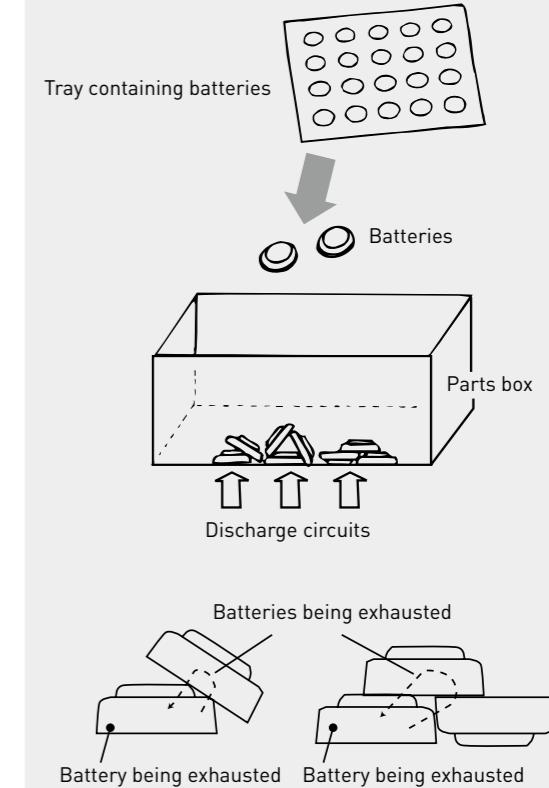

1. Remove the batteries from the tray one at a time. If the tray is turned upside down, the batteries will come into contact with each other, forming discharge circuits.

2. Do not place batteries randomly in a parts box or other container. Discharge circuits will be formed by multiple batteries coming into contact numbers of the batteries, causing the batteries to discharge and drain.

PROHIBITED PROCEDURES

Do not throw batteries randomly into a parts box by turning over trays containing batteries.

Contact of batteries with each other forms discharge circuits, thus the batteries are drained.

PREVENTING QUALITY PROBLEMS

MEMORY ERASURE PROBLEMS

Coin type lithium batteries are often used as the power supplies for memory back-up in various equipment. However problems with the erasure of valuable data in the memory due to improper contact between the batteries and equipment have been reported.

1. When batteries are to be used continuously for a prolonged period.
 - | Select tab terminal-mounted batteries, and solder the tabs to the battery connection terminals of the equipment. (See fig. 1)
 - | When batteries need to be replaced, use a battery holder (see fig. 2) or battery with lead wire connectors (see fig. 3). Battery holders made by Panasonic (exclusively for the CR-2032 and BR-2032, see fig. 2) are available for use.
 - | When batteries need to be replaced, use a battery holder (see fig. 2) or battery with lead wire connectors (see fig. 3). Battery holders made by Panasonic (exclusively for the CR-2032 and BR-2032, see fig. 2) are available for use.
2. When batteries need to be replaced in the short term, select batteries with no terminals or lead wire connectors.
 - | Use of Y-shaped terminals (2-point contact) for both the and poles as the shape of the connection terminals in the equipment helps to achieve a more stable contact. (See fig. 4)
 - | The contact pressure of the contacts should be no less than 2 to 10N (approx. 200 to 1,000gf). (See fig. 5)
 - | To prevent momentary contact failure of several milliseconds in the circuit, the use of a tantalum capacitor, etc. with a capacitance of several microfarads is effective. (See fig. 6)
 - | For the connection terminals of the equipment, use iron or stainless steel with nickel plating at the very least. Gold-plating is more suitable when the contact resistance must be reduced.

NOTE: Do not touch batteries with bare hands because perspiration (salt), body oil, etc. will increase the surface resistance which may lead to defective contact.
